

Construction of Four Slaughter House and Ancillary Buildings at Al Salamat, Ain Al Fayda, Al Quaa and Masaken

AL AIN MUNICIPALITY – UAE

Industrial Wastewater Treatment

Treating wastewater from food industries is challenging due to the high levels of BOD₅, COD and fat. Specialized equipment like Dissolved Air Flotation (DAF) is need to reduce the levels of pollutants before biological treatment. This consists of a Membrane Bio-Reactor (MBR) system that further breaks down the effluents to reach the designated parameters for disposal or reuse.

**INDUSTRIAL
WASTEWATER
4x 75 m³/day**

Slaughtering & Processing Water Treatment

In April 2016 MENA-Water accepted this challenge for four sites in the town Al Ain with plants for treating slaughter house wastewater from processing, packaging, equipment cleaning and disinfection with a MENA-Water system for 75 m³/d for each plant.

Scope and Realization

The complete turnkey design with construction and commissioning was done within 6 months and the four plants were successfully put into operation as scheduled. Additionally site visits, maintenance and monitoring for the first year of operation was part of the contract.

All equipment was supplied from approved vendors and complies with strict specifications from the Abu Dhabi Sewerage Services Company. The limited space constraints required an installation of all this equipment within smallest area of less than 100 m².

The whole plant is auto controlled using the total integrated Siemens Automation Platform. All field devices are connected to the PLC using fieldbus protocols to increase the deeper engagement of automatic controls for finer process tuning. Each of the facilities is remotely monitored by the Municipality Maintenance Management System (CMMS) using GRPS modems installed at each PLC and giving SMS alarms to operators.

Equipment	Application
Basket Screen	Coarse Particle Removal
Lifting Station	Effluent Transfer
Micro Fine Screen	Particle Removal > 1mm
Dosing System	NaOH, Ferric Chloride, Polymer
Pipe Flocculation	Chemical Addition
Dissolved Air Flotation	COD & TSS Removal
Aeration Tank No. 1 & 2	Biological Treatment
MBR Modules	Ultra-Filtration
Activated Carbon Filter.	Odour Control System
Dry Bag System	Sludge Dewatering
Field Instruments	For Flow, Level (hydrostatic), TSS, DO, Pressure
Form 2 Control Panels with PLC	Total Integrated Automation Platform with Profibus
Central SCADA linking to CMMS system	Monitoring of all Process Values in Headquarter
